

A heatmap visualization of the 2010 US Census data for the variable 'Age'. The heatmap is a grid of colored squares, where the color intensity represents the frequency or density of individuals in each age group. The colors range from dark blue (low density) to bright yellow (high density). The grid is composed of 10 rows and 20 columns of squares. The highest density (bright yellow) is concentrated in the middle rows, particularly in the 5th and 6th rows, and in the 15th and 16th columns. There are also some high-density areas in the 1st and 2nd rows, and in the 18th and 19th columns. The lowest density (dark blue) is found in the 3rd and 4th rows, and in the 17th and 20th columns.
